ANS Annual Meeting  
11-16 June 2017

- Ensure that systems are fit for the nuclear environment they are subject to:
  - ❑ evaluate radiation loads,
  - ❑ monitor design changes,
  - ❑ study/implement remedial actions, e.g. additional shielding but also other.
- Challenges:
  - ❑ Large number of systems.
  - ❑ Evolving designs.
  - ❑ Intricate & far reaching impacts in nuclear responses everywhere.
  - ❑ Complex & world-wide distribution of procurement responsibilities.
- Need for solid systems engineering approach, involving all stakeholders and sustained during design evolution and construction, which trades-off between different performance, cost and schedule requirements.
- Also need for intensive nuclear analyses using extensive and detailed 3D models, state-of-the-art acceleration techniques and massive computer resources.
- Illustrated here via example of superconducting magnets.

# introduction superconducting magnets & radiation loads

# introduction

## superconducting magnets & radiation loads

- ITER superconducting magnets:
  - ❑ 6 x poloidal field coils (10 to 25m diameter), NbTi + Cu cooled at 4K
  - ❑ 18 x toroidal field coils (10m x 7m, 450t), NBSn + Cu cooled at 4K
- Radiation sources:
  - ❑ 500 MW DT burning plasma (14.1 MeV neutrons).
  - ❑ Activated water in in-vessel cooling system, a.k.a. TCWS (<7 MeV photons from N-16 and <3.5 MeV neutrons from N-17).
- Responses of interest: on-load heat deposition, dose to insulator, fast fluence to superconductor.
- Affected by the design of all in-vessel, vessel and thermal shields.

  - ❑ Activated water in in-vessel cooling system, a.k.a. TCWS (<7 MeV photons from N-16 and <3.5 MeV neutrons from N-17).
- Responses of interest: on-load heat deposition, dose to insulator, fast fluence to superconductor.
- Affected by the design of all in-vessel, vessel and thermal shields.

- Basis of modelling:
  - ❑ Representative 40deg regular sector model: *C-lite* (preliminary) or *C-model* (final).
  - ❑ 80deg irregular sectors model: “*NBI model*”.
- Plasma source.
- TCWS source.
- MCNP6.1 + FENDL2.1 libraries (also 3.1b test).
- ADVANTG WW and source biasing,  $5 \times 10^9$  to  $1 \times 10^{10}$  original source particles.
- F4 and F6 tallies: TFC poloidal sectors and radial winding pack layers, PFC conductor turns, integrals.

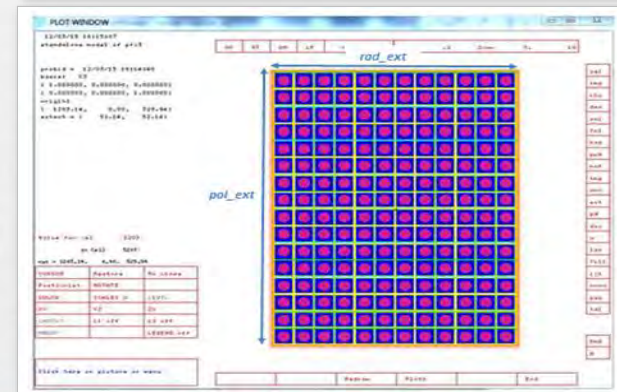

- Basis of modelling:
  - ❑ Representative 40deg regular sector model: *C-lite* (preliminary) or *C-model* (final).
  - ❑ 80deg irregular sectors model: “*NBI model*”.

# computer models and methods ITER reference neutronics models

- C-lite → C-model: large investment in order to:
  - ❑ update component representations,
  - ❑ increase detail and minimise need for corrections.
- Emphasis in quality assurance:
  - ❑ Automated conversion to MCNP from validated CAD data.
  - ❑ Standardised modelling methods.
  - ❑ Independent verifications of component representations.

# computer models and methods

## ITER reference neutronics models

# computer models and methods model improvements and design changes

*detailed blanket  
models (final  
design status)*

*gaps around UPs increased*

*outboard manifold shield  
box (MSB) mass loss*

*inboard shield  
blocks thickness  
added 20 mm*

*doglegs  
around EPs*

*small divertor mass loss*

*shielding in lower port added*

# computer models and methods model improvements and design changes

***VV heterogeneous model  
(manufacturing design  
status)***

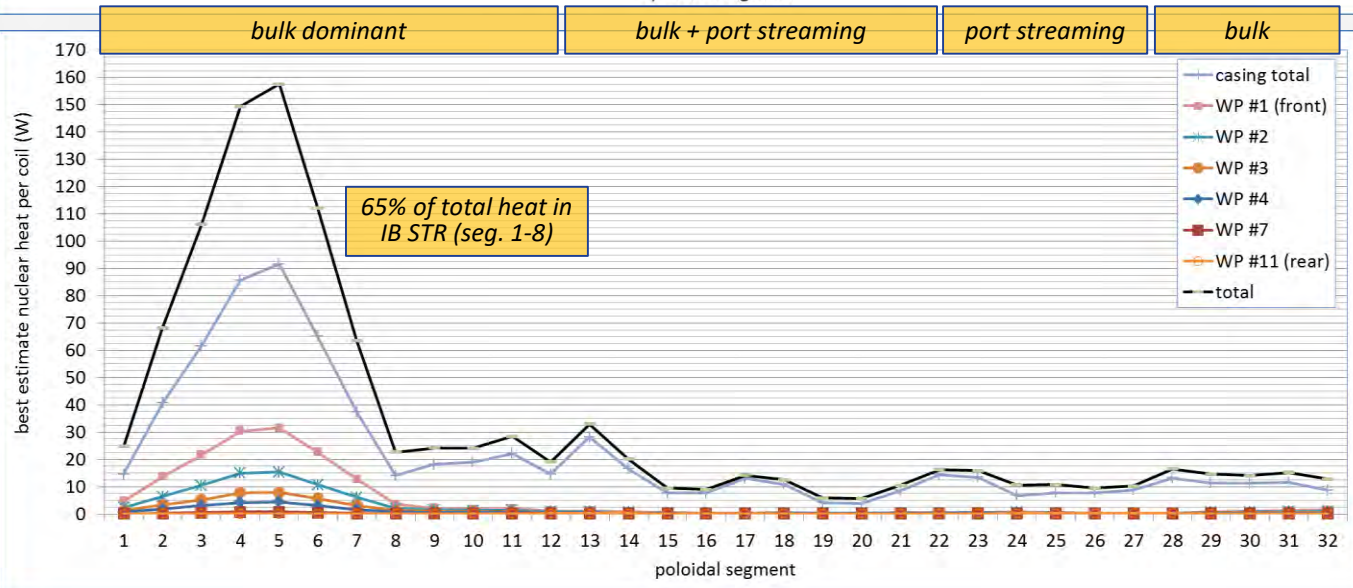

***thermal shield additional  
nuclear shield plates (ANS)  
removal***

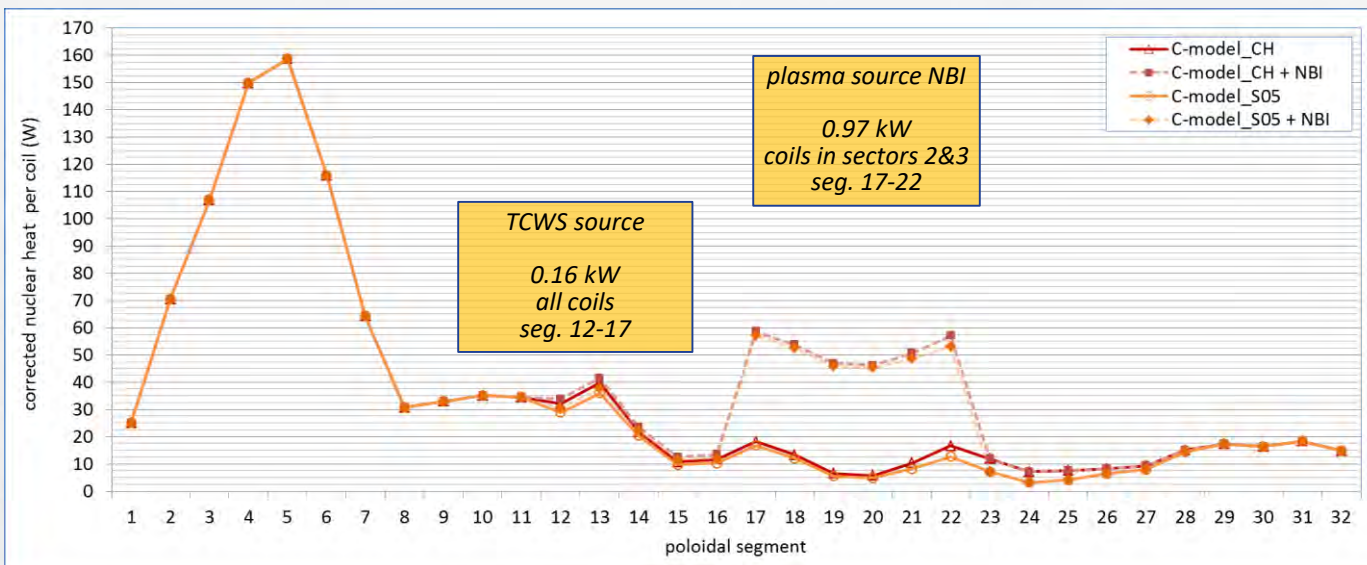

# nuclear responses in TFCs profiles

# nuclear responses in TFCs

## NBI & TCWS contributions

# nuclear responses in TFCs

## integral heating upper estimate

- Despite changes in profiles, upper integral estimate stable at 21.6 +/- 3.0 kW.
- However, more heating goes now into the winding pack of the inboard leg.
- Other measures (not shielding related):
  - Allocation of best performing conductor in NBI coils.
  - Increase of cryoplant capacity to 24 kW.
- To watch out: further in-vessel design changes and port plug design.

# nuclear responses in PFCs preliminary profiles

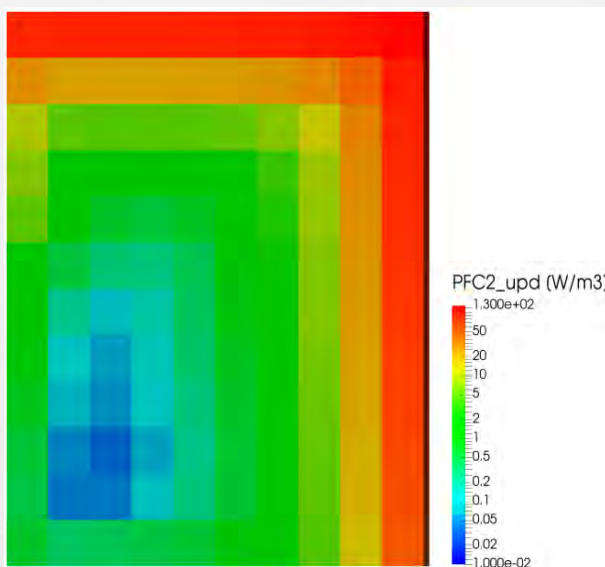

- Preliminary (C-lite) results available, final (C-model) analyses ongoing.
- Review of TCWS contribution also ongoing.
- Noticeable differences in deposition locations and profiles from regular plasma neutrons, NBI plasma neutrons, and TCWS (gamma).
- However, the three integral contributions have similar magnitude; preliminary total upper estimate at 1.9 +/- 0.3 kW (does not account for C-lite → C-model changes).

# nuclear responses in PFCs preliminary profiles

- Preliminary (C-lite) results available, final (C-model) analyses ongoing.
- Review of TCWS contribution also ongoing.
- Noticeable differences in deposition locations and profiles from regular plasma neutrons, NBI plasma neutrons, and TCWS (gamma).
- However, the three integral contributions have similar magnitude; preliminary total upper estimate at 1.9 +/- 0.3 kW (does not account for C-lite → C-model changes).

# nuclear responses in PFCs

## preliminary upper estimate integral heating

# nuclear responses in PFCs updating & mitigating contributions

# nuclear responses in PFCs updating & mitigating contributions

- Ensure that ITER superconducting magnets are fit for their nuclear environment: evaluate loads, monitor design changes and study/implement shielding and other remedies.
  - ❑ Example of challenges of nuclear integration in ITER, and of a systems engineering approach aimed at optimal compromise and overall success.
  - ❑ Also example of intensive nuclear analyses using extensive and detailed 3D models, state-of-the-art acceleration techniques and massive computer resources.
- Large effort invested in order to update component representations, reduce systematic uncertainties, and emphasise quality assurance.
- Toroidal field coils:
  - ❑ Integral and profile heating values computed to account for improved modelling and design changes affecting these parameters.
  - ❑ Some design changes had noticeable detrimental effect (e.g. at thermal shield), counteracted by introduction of additional shielding elsewhere (e.g. at lower port).
  - ❑ Consequently, heating profiles suffered some changes but the upper integral value remains stable at 21.6 +/- 3.0 kW. Minor contributions from TCWS and NBI.

- Toroidal field coils (cont'd):
  - ❑ Other mitigating actions (not shielded related) also taken.
  - ❑ Radial/poloidal profiles for the coils in different VV sectors have also been obtained.
- Poloidal field coils:
  - ❑ First preliminary profiles and conservative integral PFC heating found at 1.9 +/- 0.3 kW. NBI and TCWS contributions at same level as regular plasma.
  - ❑ Estimates of NBI and TCWS contributions considered in this and earlier work are outdated (but conservative) and being revised.
- Further remedial actions necessary:
  - ❑ Additional gamma shielding in UP chimney & chimney box.
  - ❑ Additional neutron shielding in NBI ducts.
  - ❑ Control design evolution of in-vessel, port plugs, TCWS piping (guard duct).

# Thank you for your attention!
